# NTC Thermistor – Inrush Current Limiting Devices

## Application Instruction

### Inrush current limiter

In electronic circuit which contains capacitors, filament bulbs, fluorescent lamp inverters and heaters, etc., will generate a inrush current with several ten times beyond the steady state current when it switch on. The zero-power resistance value of NTC is useful to suppress the inrush current and keep the circuit work stable.

A typical application of ICL devices( Fig. A ) The indicated in Fig. B is illustrates the ICL ( Inrush Current Limiting ) function.

### 浪湧電流抑制

在含有電容、燈絲燈泡、螢光燈整流器與加熱器..等電子電路中,在開關閉合的瞬間會產生一個比正常工作電流高出數十倍的浪湧電流,利用NTC熱敏電阻的零功率電阻值來抑制開機瞬間的浪湧電流不致於過大且不影響工作電流而使迴路正常工作。如下圖(A)。

AC電路-- A1 或 A2 與 DC電路 -- D1 或 D2 擺放位置,如下圖(B)。

## NTC Parameter Definition

### Rated Zero-Power Resistance (R25)

The resistance value measured at 25 °C ambient temperature.

### Material constant (β)

The comparison value of the resistances of a thermistor at a certain temperature and an other different temperature, it's calculated by the following formula and expressed in terms of the degrees Kelvin.

### 額定零功率電阻 (R25)

在特定溫度25°C下測得的熱敏電阻直流電阻值，也稱為零功率電阻。

### 材料常數(β)

NTC熱敏電阻在某一度之電阻與另一溫度之電阻的比較值，可由下面的公式計算得到並以卡氏溫度(K)表示

$$\beta = \ln(R1/R2) / (1/T1 - 1/T2)$$

$$T1 = 298.15^\circ\text{K}(+25^\circ\text{C}), T2 = 358.15^\circ\text{K}(+85^\circ\text{C}) \text{ for B25/85}$$

$$T1 = 298.15^\circ\text{K}(+25^\circ\text{C}), T2 = 323.15^\circ\text{K}(+50^\circ\text{C}) \text{ for B25/50}$$

### Maximum steady-state current (I<sub>max</sub>.)

(For JNR series only)

The maximum steady-state current is the rating of the maximum current, normally expressed in amperes(A), allowable to be conducted by an inrush limiting NTC Thermistor for an extended period of time.

### 最大穩態電流 ( I<sub>max</sub>.)

( For JNR series only)

NTC熱敏電阻能允許長時間通過的最大電流值,通常以安培(A)表示。

### Resistance at maximum current (R<sub>I<sub>max</sub></sub>.)

(For JNR series only)

The resistance at maximum current is the approximate resistance of an inrush current limiting thermistor, expressed in ohms(Ω), when it is conducting its rated maximum steady-state current.

### 最大穩態電流下的殘餘電阻 (R<sub>I<sub>max</sub></sub>.)

(For JNR series only)

NTC熱敏電阻通過額定最大穩定電流時的殘餘電阻，以歐姆(Ω)表示。

### Maximum Load Capacitance @AC240V

(For JNR series only )

The maximum capacitance is the maximum allowable capacitance of JNR series in power supply applications. This capacitance refers to the filter capacitance at the back end of the bridge rectifier. Generally, the recommended value of the JNR series should be greater than the value of the filter capacitance in the circuit

### 最大負載電容 @AC 240V

(For JNR series only)

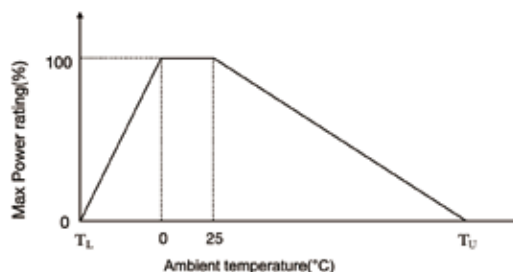

此參數為JNR系列在電源應用時，可承受的最大負載電容值。此電容是指電源橋氏整流器後端的濾波電容，一般選用JNR系列的建議電容值須大於電路中的濾波電容值。

### Maximum Rated Power Consumption (P<sub>max</sub>.)

The maximum rated power consumption is the maximum power rating applied to the thermistor continuously at 25°C ambient temperature or the specified temperature in the specification. When the working temperature is below 0°C or over 25°C, the rating power should be decreased. (see Fig. C)

### 最大額定功耗 (P<sub>max</sub>.)

最大功率額定值是在25°C的環境溫度或詳細規範中規定的溫度下，長時間施加於熱敏電阻的最大功耗。工作溫度低於0°C或高於25°C時，額定功率應降低。如下圖C

Note : T<sub>L</sub> = Minimum operating temperature(°C)  
T<sub>U</sub> = Maximum operating temperature(°C)

Fig C

For example :

Ambient temperature(T<sub>a</sub>)=55°C

Maximum operating temperature(T<sub>u</sub>)=200°C

$P_{Ta} = (T_u - T_a) / (T_u - 25) \times P_{max} = 82\% P_{max}$

### Thermal dissipation coefficient ( $\delta$ )

The thermal dissipation coefficient is ratio, it is expressed in  $mW/^{\circ}C$ , at a specified ambient temperature, of a change in power dissipation in a thermistor to the resultant body temperature change. (It can be expressed by the formula:  $\delta=V*I/\Delta T$ )

### 熱散逸係數( $\delta$ )

在一特定的環境溫度下，熱敏電阻電功率消耗對本體溫度變化量的比值，通常以 $mW/^{\circ}C$ 表示。 $(\delta=V*I/\Delta T)$

### Thermal time constant ( $\tau$ )

The thermal time constant is the time required for a thermistor to reach 63.2% of the difference between its initial and final body temperature when subjected to a step function change in ambient temperature under zero-power condition and is normally expressed in second. (See Fig.D)

Remark: the smaller the product volume is, the smaller the heat capacity and the faster the response.

### 熱時常數( $\tau$ )

在零功率情況下，當週圍溫度成步級函數變化後，其本體溫度之變化達到最初溫度與最終溫度差之63.2%時所需的時間，單位為秒數(Sec.) 表示。如下圖D。  
附註：產品體積越小，熱容量越小，響應越快。

Fig D

### Operating temperature range

Ambient temperature range for thermistor's continuous operate at zero rated power. The defined maximum and minimum operating temperatures are specified in each series.

### 工作溫度範圍

熱敏電阻器能長時間工作在零功率的環境範圍。定義最大值和最小值標示在各系列規格表中。

# NTC Thermistor – Temperature compensation & Temperature measurement

## Application Instruction

### Temperature measurement

NTC apply to the circuit of temperature measurement.  
Use NTC thermistor in one side of Wheatstone bridge.  
(see Fig.E)

### 溫度測量

NTC適用於溫度測量的電路，利用NTC熱敏電阻器來作為惠斯登平衡電橋中一邊。如下圖E。

Fig E

### Temperature control

The following figure (Fig.F) shows the basic temperature control loop combined with the Thermistor and voltage comparator. The circuit can output the Thermistor into a high and low voltage signal corresponding to its resistance value by connected with a fixed resistor (in series or in parallel) and comparator.

### 溫度控制

圖(F)是熱敏電阻和電壓比較器組合而成的基本溫度控制迴路，該電路能將熱敏電阻對應其阻值的關係透過與固定電阻串並聯及比較器輸出成高低電壓信號，利用比較器的輸出電壓控制，如：場效電晶體等開關組件來達到控溫（控制風扇轉速達到過溫保護的目的）。

Fig F

### Temperature compensation

Many semiconductor ICs and components have positive temperature characteristics, and their resistance rises as the ambient temperature rises. In the actual application, the circuit will cause signal distortion, speaker sound deviation and other issues. As the NTC Thermistors have a negative temperature characteristic, this feature can be used to temperature compensate for components with positive temperature characteristics, allowing these components to maintain stable temperature characteristics over a wide temperature range. The Fig. G is an application example of NTC Thermistor applied for temperature compensation. The loop is composed of an NTC Thermistor (RT) and a matched linear resistor (RP) connected in parallel and then connected in series with a positive temperature characteristic resistor, and the total impedance keep stable over a wide temperature range.

### 溫度補償

許多半導體IC與零組件有正溫度特性，其阻值會隨著環境溫度升高而上升，在實際應用電路上會造成問題（如：會引起信號失真、揚聲器聲音走調..等）。由於NTC熱敏電阻具有負溫度特性，可利用此特性來對正溫度特性的組件進行溫度補償，讓這些組件在較寬的溫度範圍內保持溫度特性穩定。圖G是利用NTC熱敏電阻進行溫度補償案例說明 -- 用NTC熱敏電阻(RT)和匹配的線性電阻(RP)並聯後，再與具有正溫度特性的阻件(RS)串聯所組成的迴路，總阻抗在較寬的溫度範圍內可以保持穩定性。
